"MIT School" thinking humanly

"Subsymbolic"

Symbolic Representations

A chair

- is a portable object
- has a horizontal surface at a suitable height for sitting
- has a vertical surface suitably positioned for leaning against

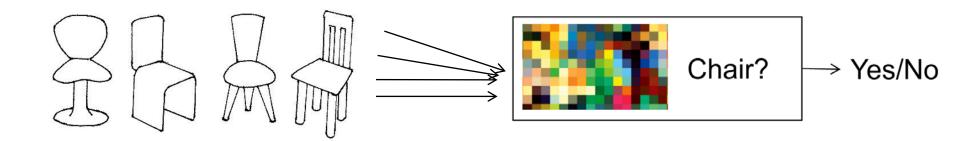

Find a definition

- using symbols, concepts, rules, some formalism
- apply automated reasoning procedures

Subsymbolic Representations

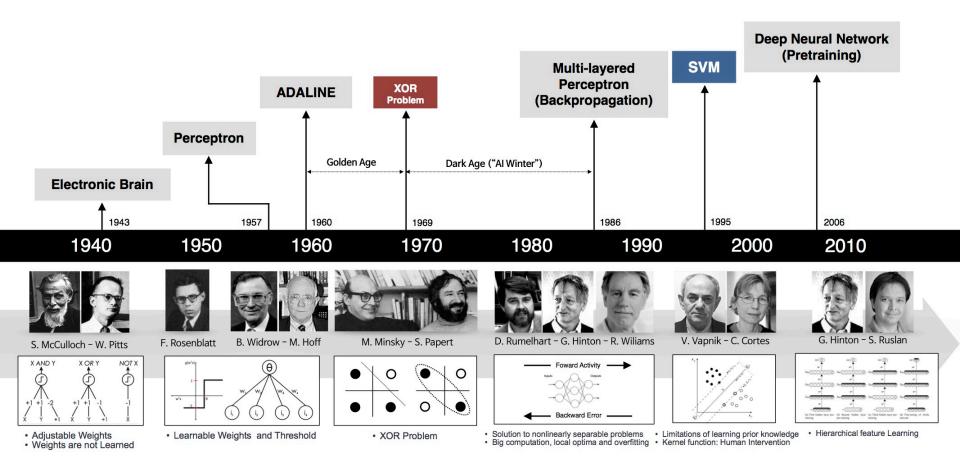

- Use many different (arbitrary) features to describe the object
 - low-level inputs bits, encoding of neurons
 - show examples to the system and let it learn a generalization pattern
- If the pattern is correct, the system has «learned» the concept without using an explicit definition

The PENDULUM of AI Methods

AI – An Interdisciplinary Research Area rooted in Computer Science – Dartmouth Proposal

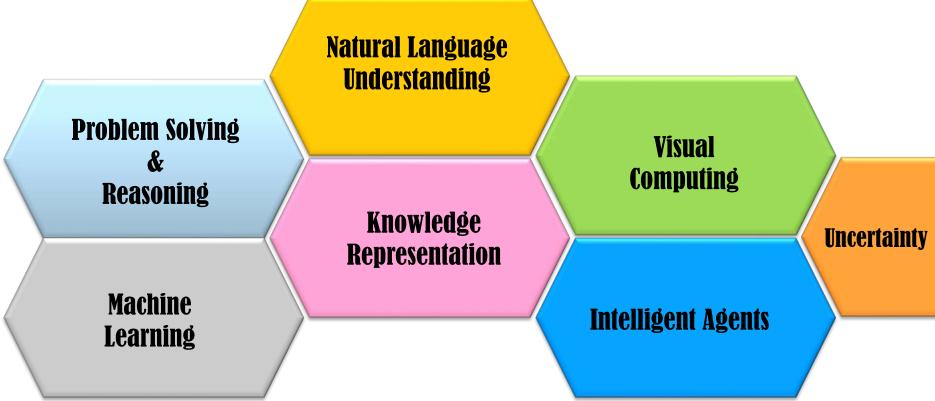

We propose that a 2 month, 10 man study of artificial intelligence be carried out during the summer of 1956 at Dartmouth College in Hanover, New Hampshire. The study is to proceed on the basis of the conjecture that every aspect of learning or any other feature of intelligence can in principle be so precisely described that a machine can be made to simulate it. An attempt will be made to find how to make machines use language, form abstractions and concepts, solve kinds of problems now reserved for humans, and improve themselves. We think that a significant advance can be made in one or more of these problems if a carefully selected group of scientists work on it together for a summer.

Important Research Areas

 1956: automatic computers (simulations), use language, neuron nets, theory of the size of a computation, selfimprovement, abstractions, randomness and creativity

Artificial Intelligence vs. Cognitive Science

Build Intelligent Software Systems

- algorithms to achieve intelligent behavior
- problems that only humans can solve are solved by computers
- do not mimic/replicate human intelligence
- part of computer science, links to mathematics, economics

Understand Human Intelligence

- what constitutes (human) intelligence?
- how do people solve problems?
- build models of human intelligence/the brain
- part of neuro & brain sciences, links to psychology

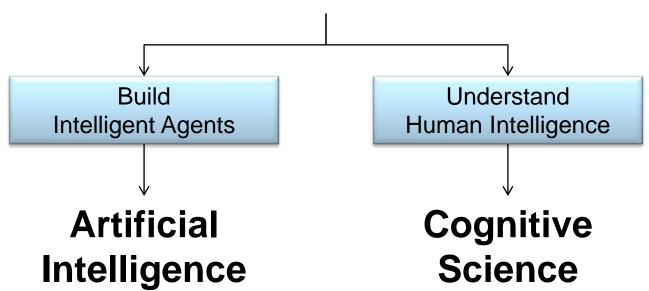

My Working Definition

Intelligence

... is the ability to define and set goals and to develop behavior to achieve these goals ...

What is Artificial Intelligence?

- The attempt to make computers more "intelligent"?
- The attempt to better understand human intelligence?
- Four approaches:
 - is it about thought thinking. . .
 - or acting?
 - oriented towards a human model (with all its defects)...
 - or normative (how should a rational being think/act)?

16

Selected Definitions

Thinking Humanly	Thinking Rationally
"The exciting new effort to make computers thinkmachines with minds, in the full and literal sense." (Haugeland, 1985)	"The study of mental faculties through the use of computational models." (Charniak and McDermott, 1985)
"[The automation of] activities that we as- sociate with human thinking, activities such as decision-making, problem solving, learn- ing" (Bellman, 1978)	"The study of the computations that make it possible to perceive, reason, and act." (Winston, 1992)
Acting Humanly	Acting Rationally
6 ,	Acting Nationally
"The art of creating machines that perform functions that require intelligence when per- formed by people." (Kurzweil, 1990)	"Computational Intelligence is the study of the design of intelligent agents." (Poole et al., 1998)

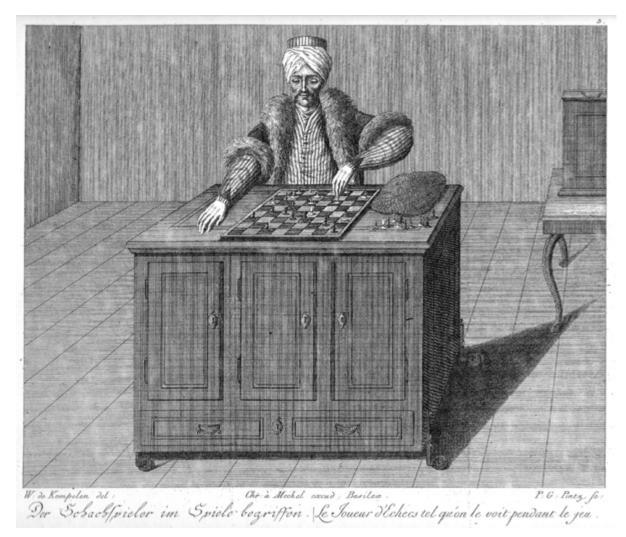

Thinking Humanly

- What cognitive capabilities are necessary to produce intelligent performance?
- Not important: Being able to solve problems correctly
- Important: Being able to solve problems like a human would
- Cognitive science and cognitive psychology
 - Introspection (observing ourselves)
 - Psychological experiments
 - > Brain research
 - ... will not be discussed in this course

Acting Humanly: The Mechanical Turk 1770 - 1854

Wolfgang von Kempelen

Thinking Rationally

- What are the laws of thought?
- How should we think?

"Socrates is a man, all men are mortal, Socrates is mortal."

- Represent problems using a formal notation
- Use computational laws to derive conclusions
- Early greek philosophers, e.g. Aristoteles
 - Drawing correct conclusions using logical rules
 - Logical formalisms play a major role in AI although commonsense and everyday knowledge cannot be captured in logic alone

Acting Rationally

- Rational agents (or rational actors)
- A rational agent acts so as to achieve its given goals, under the assumption that its impressions of the world and its convictions are correct
- Rational thinking is a prerequisite for rational acting, although it is not a necessary condition
 - what to do, for example, when we must make a decision faced with insufficient information?
- We look at the concept of a rational agent in more detail later ...

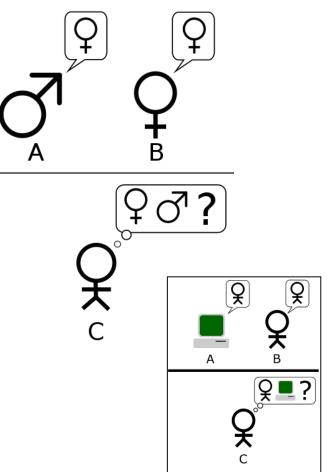

The Turing Test

"The new form of the problem can be described in terms of a game which we call the 'imitation game.' It is played with three people, a <u>man (A)</u>, a <u>woman (B)</u>, and an interrogator (C) who may be of either sex. The interrogator stays in a room apart front the other two. The object of the game for the interrogator is to determine <u>which of the</u> <u>other two is the man and which is the woman</u>.

It is <u>A's object in the game to try and cause C to</u> <u>make the wrong identification</u>. <u>The object of the</u> <u>game for (B) is to help the interrogator</u>.

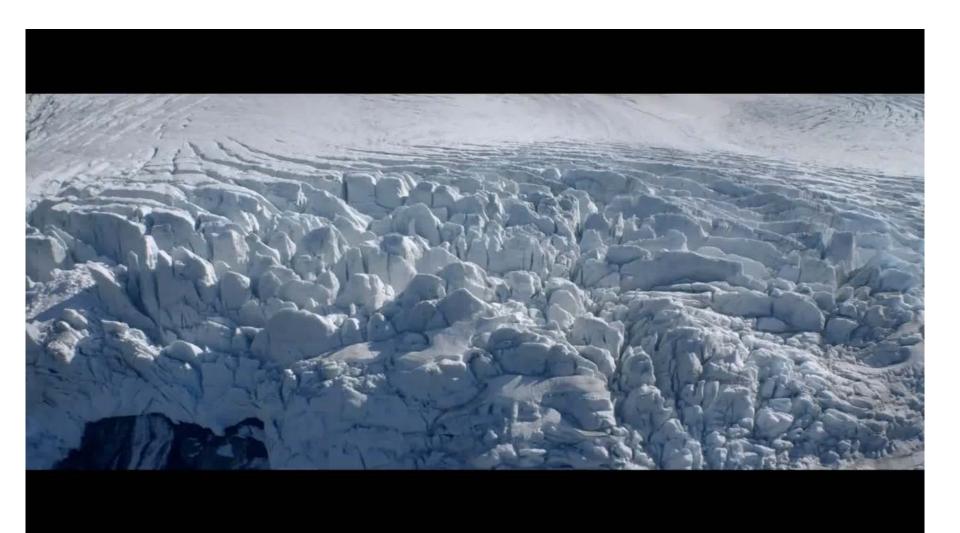

... We now ask the question, "What will happen when a <u>machine takes the part of A</u> in this game?" ... These questions replace our original, "Can machines think?"

The new problem has the advantage of drawing a fairly sharp line between the physical and the intellectual capacities of a <u>man</u>." A man trying to convince the interrogator that he is a woman, is replaced by a computer trying to convice the interrogator that it is a human (or woman?)

Artificial Intelligence - Introduction

A Bit of Al History

Major Phases

- 1943 1955
 - neural networks, basic learning mechanisms, genetic algorithms
- 1956 Darthmouth Conference
 - "Artificial Intelligence" as a research programme
 - AI as part of computer science
 - duplicating human skills such as creativity, selfimprovement, use of language
 - building machines that will function autonomously in complex and changing environments

Early Successes

- 1952 1969
 - logical theorem proving, game playing programms,formal models of the world, various logic-based inference mechanisms

Physical symbol system hypothesis

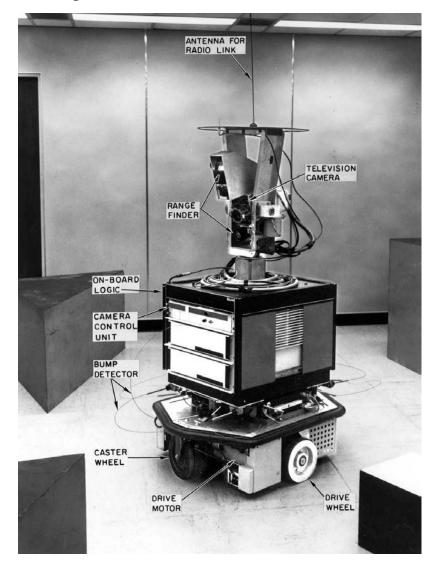

"a physical symbol system has the necessary and sufficient means for general intelligent action"

Microworlds: small (toy) domains on which these systems operated

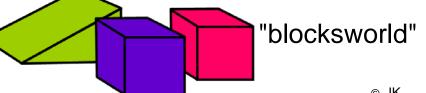

Shakey the Robot - Stanford Research Institute 1966 - 1972

Early Enthusiasm

"It is not my aim to surprise or shock you – but the simplest way I can summarize is to say that there are now in the world machines that think, that learn and that create.

Moreover, their ability to do these things is going to increase rapidly until — in a visible future — the range of problems they can handle will be coextensive with the range to which the human mind has been applied." 1957

Herbert Simon Nobel prize 1978

"for his pioneering research into the decision-making process within economic organizations"

A Dose of Reality 1966 – 1973

- Pure syntatic manipulations led to infamous failures in language translation
 - "the spirit is willing, but the flesh is weak" = the vodka is good, but the meat is rotten
- Intractability of many problems
 - exhaustive enumeration of variants does not scale in exponential state spaces – *combinatorial explosion*
- Limitations of many mechanisms only slowly understood
 - perceptrons can learn everything they can represent but they can represent very little

LISP (1958 John McCarthy)

```
;; Add 2 and 3 and 4:
(+ 2 3 4)
```

```
;; Set the variable p to the value
3.1415:
(setf p 3.1415)
```

```
;; Define a function that squares
its argument:
(defun square (x)
  (* x x))
```

```
;; Square the number 3:
(square 3)
```

PROLOG (1972 Alain Colmerauer)

```
% Prologue text with facts:
father(adam, tobias).
father(tobias, frank).
father(tobias, ulrike).
```

```
% Prologue text with rule:
grandfather(X, Y) :-
father(X, Z),
father(Z, Y).
```

```
grandfather(X, Y) :-
   father(X, Z),
   mother(Z, Y).
```

```
?- grandfather(adam, ulrike).
yes.
?- grandfather(X, frank).
X=adam
```

Knowledge-Based Systems 1969 – 1985 – the Key to Power?

- Adding more domain knowledge to an AI system
 - learn from human experts
- Explicit representations of rules, plans, goals, states, objects, confidence/uncertainty
 - "frames" concept logics ontologies
- From "weak" to "strong" methods
- AI technology companies

Mycin 1973

An Artificial Intelligence Program to Advise Physicians Regarding Antimicrobial Therapy*

EDWARD H. SHORTLIFFE[†], STANTON G. AXLINE, BRUCE G. BUCHANAN, THOMAS C. MERIGAN, AND STANLEY N. COHEN

Stanford University, Stanford, California 94305

SAMPLE RULE

LISP

PREMISE:

(\$AND (SAME (VAL CNTXT GRAM) GRAMPOS) (SAME (VAL CNTXT MORPH) COCCUS) (SAME (VAL CNTXT CONFORM) CHAINS) 3)

ACTION:

(CONCLUDE CNTXT IDENT STREPTOCOCCUS TALLY .7)

ENGLISH TRANSLATION

IF:

THE GRAMSTAIN OF THE ORGANISM IS GRAMPOS, AND THE MORPHOLOGY OF THE ORGANISM IS COCCUS, AND THE GROWTH CONFORMATION OF THE ORGANISM IS CHAINS

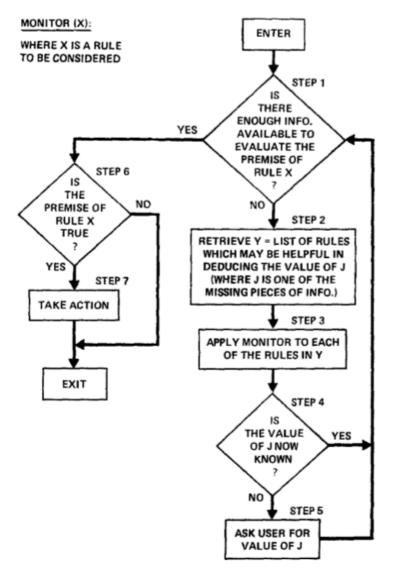

THEN:

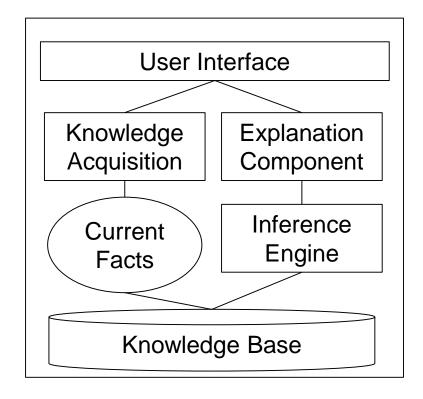

CONCLUDE THAT THE IDENTITY OF THE ORGANISM IS STREPTOCOCCUS (MODIFIER: THE CERTAINTY TALLY FOR THE PREMISE TIMES .7)

Mycin Inference Engine

Knowledge-Intensive ("strong") versus Knowledge-Sparse Approaches ("weak")

- Knowledge-sparse: axioms, some facts + strong inference mechanisms
 - Google search uses indexing + the page rank
 - Heuristic and stochastic search in Deep Blue Chess Computer
 - Theorem proving in Logic theorist
- Knowledge-intensive: domain ontologies and encoded knowledge bodies
 - Chess opening book
 - Expert systems, e.g. Mycin
 - Google user profiles

Al Winter (1987–93)

- Subsymbolic (connectionist) approaches remained vague
- Understanding Speech remains a challenge
- LISP machine market collapsed
- Expert systems did not scale and could not handle contradictory knowledge and beliefs
- Japan's 5th generation computer systems project never managed to provide concurrent logic programming on special hardware

Data-Driven AI (since 2000)

- Significant progress in all AI subfields
 - better understanding of problems and complexity properties
 - increased mathematical sophistication
- Scalable, robust algorithms and well-understood expressive representation formalisms
- Maturity of AI programming frameworks
- AI services and solutions by major IT vendors (e.g. Amazon AWS, Facebook PyTorch, Google Keras/TensorFlow)

Digital Transformation paves Ground for AI Revolution

- Internet access everywhere for everybody
- Digital transformation generates a lot of data
- Applications with billions of users
- Cloud services & elastic computing
- Maturity of software development

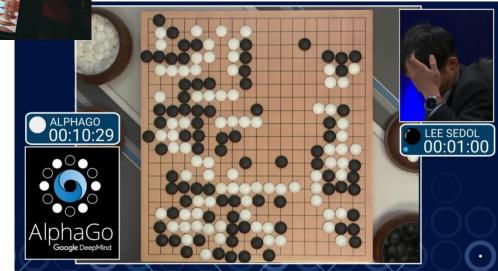

Deep Blue and AlphaGo – Important Milestones

2016

1997

Deep Blue 1996/97

- Winner against world champion Garri Kasparow
- Brute force computing power, written in C
- Massively parallel, RS/6000 SP Thin P2SC-based system with 30 nodes each node containing a 120 MHz P2SC, enhanced with 480 special purpose VLSI chess chips
- Capable of evaluating 200 million positions per second, 11.38 GFLOPS
- 259th on TOP500 supercomputer list in June 1997

Deep Blue's Opening Book and Evaluation Function

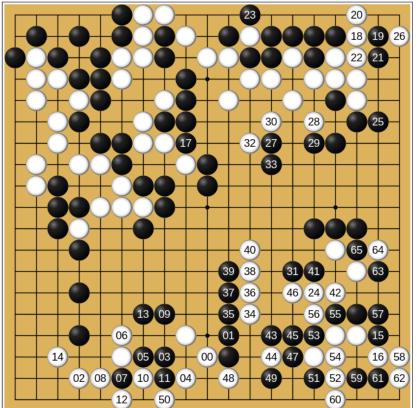

- Evaluation function was initially with many to-be-determined parameters, optimal values for these parameters were determined by the system itself by analyzing thousands of master games
- Opening book contained over 4,000 positions and 700,000 grandmaster games
 - provided by grandmasters Miguel Illescas, John Fedorowicz, Nick de Firmian
 - Chess knowledge finetuned by grandmaster Joel Benjamin

AlphaGo and AlphaZero 2016/2017

- Game tree complexity 10³⁶⁰ (chess 10¹²³)
- No known heuristic methods to evaluate a situation on a Go game board
- Learn evaluation from analyzing millions of Go games
- Use stochastic search to determine promising next moves

A 20-Year Community Roadmap for Artificial Intelligence Research in the US

Yolanda Gil (USC) and Bart Selman (Cornell), co-chairs

Summary

- Artificial Intelligence is a vivid research area with many different communities, opinions, and technologies
- The history of AI is marked by big successes, but also hypes and failures
- The increase in computing power, the availability of data, and the progress in all AI subfields has led to remarkable achievements over the last decade
- Each AI technology has its limitations and risk management as well as ethical considerations are very important when bringing AI into applications
- The next challenge for AI will be to master the "Four Big "A": abstraction, analogy, argumentation, arbitrary common sense

Steven Spielberg: Artificial Intelligence, 2001 (Introductory Scene)

Initial part available via youtube: <u>https://www.youtube.com/watch?v=nqlhYcPx4K0</u> Watch final part of the introductory scene via the CMS: Information > Materials > Videos

Working Questions

- 1. What is Artificial Intelligence about?
- 2. What do we mean by a symbolic or subsymbolic representation?
- 3. What are weak (knowledge-sparse) and strong (knowledge-intensive) methods?
- 4. What characterizes the main historic phases of AI research?
- 5. Discuss risks and opportunities of AI technology in the light of your own opinion.
